

Evidence check

updated 12 April 2020

Rapid evidence checks are based on a simplified review method and may not be entirely exhaustive, but aim to provide a balanced assessment of what is already known about a specific problem or issue. This brief has not been peer-reviewed and should not be a substitute for individual clinical judgement, nor is it an endorsed position of NSW Health.

Palliative care and COVID-19

Rapid review question

What evidence is available on the organisation of palliative care services during COVID-19 (or previous pandemics)?

In brief

Published guidance varies in the use of stepped approaches to palliative care as demand increases in the course of the COVID-19 outbreak:

- Guidelines from Switzerland emphasise the importance of providing access to palliative care, clarifying goals in advance, interdisciplinary team decisions and psychosocial and spiritual needs
- A rapid review of previous pandemics and insights from experts in the field both acknowledge the need to respond rapidly and flexibly to changing circumstances, to train non-specialists in palliative care, deploy volunteers, and use technology to support communication with patients and carers
- A case report of a staged model for providing palliative care outlines what comprises 'conventional', 'contingency' and 'crisis' models of care
- A narrative article outlines a pandemic plan with four key themes; 'stuff' (stockpile medications for common symptoms), staff (identify all clinicians with palliative care expertise), space (identify wards that could accommodate large numbers of people) and systems (create a triage system).

Background

Older, often frail, people are at highest risk for severe and fatal COVID-19 infections. Severe illness with an uncertain outcome call for good palliative care of patients. (1) This review aims to synthesis the evidence available of palliative care services during COVID-19 or previous pandemics.

Limitations

New evidence on this topic is emerging rapidly. The evidence is generally based on case studies and expert opinion. Health systems differ in the models of palliative care provided pre-COVID-19.

Methods (Appendix 1)

Google and PubMed were searched on 28 March using terms palliative care and COVID-19, and was updated on 12 April.

World Health Organisation - Integrating palliative care and symptom relief into the response to humanitarian emergencies and crises: a WHO guide 2018	<p>Outlines broad principles of palliative care during and epidemic including:</p> <ul style="list-style-type: none"> • Put in place policies • Train and equip staff • Include essential palliative care medicines in emergency health kits • Seek partnerships • Recruit volunteers • Support staff • Provide information 	https://apps.who.int/iris/bitstream/handle/10665/274565/9789241514460-eng.pdf?sequence=1&isAllowed=y
Oxford university press - Palliative Care Needs of People Affected by Natural Hazards, Political or Ethnic Conflict, Epidemics of Life-threatening Infections, and Other Humanitarian Crises 2019	<p>Regardless of the types of humanitarian crisis or the types of suffering it causes, several principles apply to the triage process:</p> <ol style="list-style-type: none"> 1. Palliative care and life-saving treatment should not be regarded as distinct. Palliative care should be integrated as much as possible with life-saving treatment for patients with acute life-threatening conditions (triaged red). 2. Palliative care must be provided for all patients deemed expectant (triaged blue) and should commence immediately. 3. Palliative care should commence immediately, as needed, for patients with non-life-threatening conditions whose injury- or disease-specific treatment may be delayed (triaged yellow). 4. Repeat triage should be practiced, especially for patients triaged blue and yellow, to make sure that important changes in the patient's condition that should result in a change in triage category are not missed. 	https://oxfordmedicine.com/view/10.1093/med/9780190066529.001.0001/med-9780190066529-chapter-2?print=pdf

Table 2.3. Recommended Triage Categories in Humanitarian Emergencies and Crises		
Category	Color Code	Description
1. Immediate	Red	Survival possible with immediate treatment. Palliative care should be integrated with life-sustaining treatment as much as possible.
2. Expectant	Blue	Survival not possible given the care that is available. Palliative care is required.
3. Delayed	Yellow	Not in immediate danger of death, but treatment needed soon. Palliative care and/or symptom relief may be needed immediately.
4. Minimal	Green	Will need medical care at some point after patients with more critical conditions have been treated. Symptom relief may be needed.
