Evidence check

Palliative care and COVID-19

Rapid review question
What evidence is available on the organisation of palliative care services during COVID-19 (or previous pandemics)?

In brief
Published guidance varies in the use of stepped approaches to palliative care as demand increases in the course of the COVID-19 outbreak:

- Guidelines from Switzerland emphasise the importance of providing access to palliative care, clarifying goals in advance, interdisciplinary team decisions and psychosocial and spiritual needs
- A rapid review of previous pandemics and insights from experts in the field both acknowledge the need to respond rapidly and flexibly to changing circumstances, to train non-specialists in palliative care, deploy volunteers, and use technology to support communication with patients and carers
- A case report of a staged model for providing palliative care outlines what comprises ‘conventional’, ‘contingency’ and ‘crisis’ models of care
- A narrative article outlines a pandemic plan with four key themes; ‘stuff’ (stockpile medications for common symptoms), staff (identify all clinicians with palliative care expertise), space (identify wards that could accommodate large numbers of people) and systems (create a triage system).

Background
Older, often frail, people are at highest risk for severe and fatal COVID-19 infections. Severe illness with an uncertain outcome call for good palliative care of patients. (1) This review aims to synthesis the evidence available of palliative care services during COVID-19 or previous pandemics.

Limitations
New evidence on this topic is emerging rapidly. The evidence is generally based on case studies and expert opinion. Health systems differ in the models of palliative care provided pre-COVID-19.

Methods (Appendix 1)
Google and PubMed were searched on 28 March using terms palliative care and COVID-19, and was updated on 12 April.

| Creating a palliative care inpatient response plan for COVID-19 – the UW Medicine Experience (University of Washington, Seattle, USA) Fausto et al, 2020 (2) | Developed a strategy to implement a palliative care response for a multi-hospital healthcare system that incorporates conventional capacity, contingency capacity, and crisis capacity  
- focuses on the ED, ICU, and acute care services.  
- key content areas including identifying and addressing goals of care, addressing moderate and severe symptoms, and supporting family members. | [https://www.sciencedirect.com/science/article/pii/S0885392420301767?via%3Dihub](https://www.sciencedirect.com/science/article/pii/S0885392420301767?via%3Dihub) |
| Palliative Care Pandemic Pack: a Specialist Palliative Care Service response to planning the COVID-19 pandemic (New Zealand) Ferguson and Barham, 2020 (3) | Describes the Waikato Palliative Care Pandemic Pack which was developed to disseminate information, guidance, and resources to enable rapid up-skilling of non-specialist clinicians needing to provide palliative care. Includes:  
- guidance for organisations and clinicians  
- management of dyspnoea  
- management of respiratory secretions  
- management of delirium  
| The Role and Response of Palliative Care and Hospice Services in Epidemics and Pandemics: A Rapid Review to Inform Practice During the COVID-19 Pandemic (UK) Etkind et al, 2020 (4) | Hospice and palliative services have an essential role in the response to COVID-19 by:  
- responding rapidly and flexibly;  
- ensuring protocols for symptom management are available, and training non-specialists in their use;  
- being involved in triage;  
- considering shifting resources into the community;  
- considering redeploying volunteers to provide psychosocial and bereavement care;  
- facilitating camaraderie among staff and adopt measures to deal with stress;  
- using technology to communicate with patients and carers;

| Kunz et al, 2020 (1) | Principles for palliative care triage include: | [1](https://pubmed.ncbi.nlm.nih.gov/32208497/)
- All dying COVID19 patients should have access to palliative care. All triage policies should underline the pivotal role of palliative care for all patients who are likely to die from COVID-19 especially given their high symptom burden
- Prevent triage discussions by clarifying goals of care with the patients in advance
- Involve a palliative care specialist in complex triage decisions. Decisions should involve an interdisciplinary team, e.g. with an intensive care physician, an internist, and a palliative care specialist, and should never rest on a single person alone
- Psychosocial and spiritual care of patients, relatives and health care professionals are of utmost importance. The availability of qualified psychosocial and spiritual support, including in particular bereavement services, is essential. **Clinical options of palliative care during COVID-19** If the medical decision is to offer palliative care, the decision whether this should take place in a hospital setting or in the nursing home depends on:
  - The severity and complexity of symptoms and additional care needs
  - The nursing home/ambulatory care capacity of delivering quality palliative care
  - The availability of hospital/palliative care unit beds
  - The patients wish |
## Statement on Coronavirus Disease 2019 (COVID-19), Palliative Care Australia

**Key principles:** This includes understanding people’s preferences and wishes, developing clear goals of care and helping patients undertake advance care planning.

- The group have put together immediate issues that warrant consideration:
  - Access to - and stock of - the appropriate prescription medicines
  - Optimising telehealth for reduced face to face consultations
  - Protecting healthcare workers (e.g. PPE)
  - Advanced care planning

## Palliative care network framework in response to COVID-19 emergency – Bologna Italy

- Patients are managed by phone where possible
- Video calls are encouraged where possible to improve clinical assessments
- Suitability of any current non-lifesaving treatment be reviewed and the use of diagnostic tests reduced to a minimum
- Seek the advice of specialist colleagues regarding the potential adjustment of treatment that requires continuous clinical and laboratory monitoring, for patients in the advanced stages of disease
- The home delivery of drugs will be organised for delivery without any direct contact if resources allow or a family member could collect
- Regarding home care, patient visits are possible, but only after a telephone consultation and where care cannot be organised in another way
- The medical history questionnaire was completed first (which shows if suspected COVID-19)
- If not suspected COVID-19, home visit takes place with standard PPE
- If indicates COVID-19, a home visit may not take place

Systematic review (descriptive)
Nouvet et al, 2018

Palliative care needs and interventions provided in crises, challenges of care provision particularly due to inadequate pain relief resources and guidelines, a lack of consensus on the ethics of providing or limiting palliative care as part of humanitarian healthcare response, and the importance of contextually appropriate care. Four main themes were found: the complexity of defining palliative care needs, characteristics of palliative care provision, ethical rationales and potential objections to providing palliative care and recommendations for best practices of palliative care.

| Stockpile medications for common symptoms:  
  - Opioids for dyspnea and pain  
  - Haloperidol or metoprolol for nausea and vomiting  
  - Skin ointment for secretions  
  - Stockpile equipment to deliver medications  
  - Subcutaneous tubefeeding  
  - Continuous drug delivery pumps  
Prepare kits including medications and equipment to deliver medications for long-term care facilities and home care services.  
Identify all clients with palliative care expertise:  
  - Physicians  
  - Nurse specialists  
Provide focused education sessions to frontline staff for symptom management and end-of-life care for H1N1 patients.  
Develop standardized order sets and protocols for symptom management and end-of-life care for H1N1 patients.  
Involves specialist allied health care workers to provide psychosocial support and bereavement counseling:  
  - Social workers  
  - Spiritual care staff  
Identify wards and nonclinical areas in all health care facilities that would be appropriate to accommodate large numbers of patients expected to die.  
Maximize the use of identified palliative care unit, hospice, and ward beds.  
Create a triage system to identify patients in need of specialist palliative care management care.  
Create a triaging system for intrastate, interfacility, and community transfers to dedicated palliative care units.  
Hospices and wards.  
Create a system for direct consultation support for staff in hospitals, long-term care facilities, and the community by telephone or telemedicine.  
Ensure that all patients currently admitted to health care facilities have clear and updated advance care plans.
